

✓ PROPOSED REVISION v2 – This is the revised Why NEWWORK page incorporating the three-era narrative and message house Level 2 positioning. Compare against the current version at [index.html](#).

#### WHY NEWWORK

# Every era of enterprise software solved the last problem. And created a new one.

Mainframes had everything in one place but nothing you could change. Best-of-breed gave you the best tools but fragmented the landscape. Customizable software gave you control but cost three years and a consulting bill equal to the license. NEWWORK is where that pattern ends.

[See the platform](#)[Read the whitepaper →](#)

#### THE HISTORY

## Three eras. Three problems. One pattern.

Enterprise software has always been sold as the answer to whatever the previous generation got wrong. The problem is that each answer came with a new cost – and that cost always landed on the people running the organization, not on the software.

### Mainframe

Everything in one place. HR, finance, operations – one software, one vendor, one truth. The tradeoff was that you got what you were given. The software was fixed. Your company adapted to it.

### Best-of-breed

No single vendor could be excellent at everything. You picked the best HR system, the best finance system, the best CRM. Functionality improved. But the landscape fragmented. Integration became its own industry. Work that should have moved between systems started landing on people instead.

### Customizable software

You could bend the software to match how your organization actually operated. And it worked – until implementation cycles stretched to three years, consulting costs equalled or exceeded the license, and teams were exhausted before a single user logged in. By the time the project went live, the requirements had changed.

### NEWWORK

For the first time, the software adapts to the organization. Value packs deliver 90% out of the box. The remaining 10% you configure within defined guardrails. Your policies, your org structure, your approval logic – these govern how the platform operates, not the other way around.

#### WHAT CHANGED

## Every feature is a prompt away. The buying decision based on features is over.

CIOs will not make platform decisions based on feature lists going forward. The question is no longer which system has the functionality you need. AI can generate that

functionality. The question is which platform can govern how AI executes it - across your existing systems, under your policies, with a complete record of what happened and why.

**Value packs deliver 90% out of the box**

Standard workflows for workforce, spend, revenue, and service are ready to deploy. No three-year implementation. No requirements document that is outdated before go-live.

**The remaining 10% conforms to your organization**

Customization happens within defined API guardrails. The software adapts to how your organization operates. Your organization does not adapt to the software.

**Agents inherit your org structure**

AI agents in NEWWORK operate within the same access rights, policies, and approval structure as the people working alongside them. Governance is not a layer on top. It is how execution works.

**Existing systems stay**

NEWWORK connects the systems your organization already runs. SAP, Workday, Salesforce, ServiceNow - they remain the systems of record. NEWWORK is the execution layer that runs work across them.

WHAT MAKES NEWWORK DIFFERENT

The first time the software adapts to the organization.

Every prior era required the organization to change to fit the software. NEWWORK inverts that. Your policies, your org logic, your approval structure - these govern how the platform operates, not the other way around.

**Governance**

Controls are part of the workflow: identity, permissions, policy checks, approvals, monitoring, and evidence.

**FLOW orchestration**

Intent becomes routed work across people, agents, tools, and systems of record.

**Human + agent execution**

Agents move work forward while people stay in control of judgment, exceptions, and commitments.

**Enterprise context**

Policies, documents, data, ownership, and system context become usable inside the execution path.

[See governance controls](#) →

**FOUNDER PERSPECTIVE**

**This is not another feature cycle. It is an operating model reset.**

The next generation of enterprise systems will not only store transactions or generate recommendations. They will execute work under policy, permission, and human control.

[Read the founder narrative](#) →

**OPERATING MODEL RESET**

**From records and assistants to governed execution.**

Systems of record keep truth. Assistants create output. NEWWORK connects truth, output, authority, workflow, and evidence so the enterprise can move.

THE ENTERPRISE AI

Enterprise AI does not have to start with a three-year program.

Start with one workflow. Tell us where work is breaking today.

WHY NEWWORK

Enterprise systems record work. NEWWORK runs it. AI has entered everyday work, but most enterprises still lack a safe way to let it act. NEWWORK is the governed execution layer that connects systems, people, policies, workflows, and agents.

WHY NOW

AI is no longer only a tool for generating answers.

The enterprise question has changed. Leaders now need to know where AI is allowed to act, which policies apply, who approves, which systems update, and what evidence is left behind.

01 Context

02 Policy

03 FLOW

04 Action

05 Human control

06 Evidence

CATEGORY OPENING

The shift is from AI output to governed execution.

The winning enterprise AI layer will be the one that can safely run work across systems, people, policies, and agents.

**Build AI agents with enterprise roles**

Define what an agent can do, which tools it can use, who owns it, and where human review is required.

**Put agents into governed FLOWS**

Turn prompts and decisions into executable workflows with routing, approvals, exceptions, and evidence.

**Connect external systems and context**

Give AI controlled access to systems of record, documents, policies, tools, and business data.

**Let work execute with control**

Agents and people complete work under policy, permission, human-in-the-loop approval, and audit-ready monitoring.

WHAT MAKES NEWWORK DIFFERENT

The platform turns governance into operating infrastructure.

NEWWORK is not another assistant and not a replacement project. It is the execution layer that makes existing systems, data, people, policies, and agents work together.

Enterprise AI needs control before action.

**Governance**  
Controls are part of the workflow: identity, permissions, policy checks, approvals, monitoring, and evidence.

**FLOW orchestration**  
Intent becomes routed work across people, agents, tools, and systems of record.

**Human + agent execution**  
Agents move work forward while people stay in control of judgment, exceptions, and commitments.

**Enterprise context**  
Policies, documents, data, ownership, and system context become usable inside the execution path.

**OPERATING MODEL RESET**

**From records and assistants to governed execution.**

Systems of record keep truth. Assistants create output. NEWWORK connects truth, output, authority, workflow, and evidence so the enterprise can move.

THE ENTERPRISE AI

Build the layer that runs enterprise work.

Connect what exists, govern every step, and start where the business needs execution now.
