

THE NEWWORK ENTERPRISE AI

Every system digitized the process. None finished the job.

NEWWORK is the governed execution layer where the job gets done. Build AI agents, place them into governed FLOWS, connect the systems they run across, and let work execute - under policy, approvals, and a complete audit trail.

- Connect systems
- Execute with control

WHY NEWWORK

Enterprise systems record work. NEWWORK runs it.

Every ERP, HRIS, and workflow tool your organization has deployed digitized the process. None of them moved the coordination cost off the person. Approvals still land in inboxes. Handoffs still break at system boundaries. AI copilots still produce recommendations that someone else has to act on. NEWWORK is the first time the burden moves from the person to the platform.

See the platform →

- Build AI agents with enterprise roles

Define what an agent can do, which tools it can use, who owns it, and where human review is required.
- Put agents into governed FLOWS

Turn prompts and decisions into executable workflows with routing, approvals, exceptions, and evidence.
- Connect external systems and context

Give AI controlled access to systems of record, documents, policies, tools, and business data.
- Let work execute with control

Agents and people complete work under policy, permission, human-in-the-loop approval, and audit-ready monitoring.

ARCHITECTURE

Build agents, connect systems, and run governed FLOWs above your systems of record.

Systems of record remain the source of truth. NEWWORK becomes the execution layer that turns context, policy, agents, people, and system updates into controlled work.

PLATFORM LAYERS

One platform architecture with defined layers.

Every layer has one concrete job: create agents and apps, connect enterprise systems, orchestrate work, route decisions to people, and keep execution under control.

CORE RUNTIME AND CONTROL

AI Fabric, FLOW, Governance, and Connect

The governed execution layer. Agents get roles, tools, context, monitoring, approvals, and human control. Workflows route across people, agents, tools, and systems with policy, audit evidence, and full compensability.

HUMAN WORK SURFACE

Every

The intelligent workplace where employees and managers see, approve, collaborate, and control AI-executed work. Tasks, approvals, documents, agent handoffs, and business actions in one governed surface.

[Explore Every](#) →

DESIGN LAYER

Create and AI Builder

Turn enterprise-specific work into governed apps, agents, and FLOWs. Build them manually or describe your process in natural language and let NEWWORK AI create it for you - inside platform governance throughout.

HOW CUSTOMERS START

One platform. Three practical entry points.

The platform stays visible whether the first entry motion is foundation, outcome, or builder-led.

ENTERPRISE AI FOUNDATION

Start with Enterprise AI Foundation

Stand up the foundation for agents, FLOWs, system connections, governance, Every, Create, and AI Builder.

[View Foundation offer](#) →

VALUE PACK

Start with a Value Pack

Deploy ready workflows, agents, policies, integrations, screens, and demo paths around one business outcome.

[Explore Value Packs](#) →

BUILDER LAYER

Build with Create and AI Builder

Let business and IT teams create agents, apps, FLOWs, tools, and extensions inside the governed platform.

[Explore builder layer](#) →

GOVERNANCE AND SECURITY

In NEWWORK, every AI action is a governed action.

Every AI action in NEWWORK is an enterprise action: permissioned before it runs, routed by policy, approved by the right person, recorded completely, and reviewable in natural language – not just what happened, but why.

Agent identity and lifecycle

Policy-aware workflow routing

Role and permission checks

Human approval gates

Tool and system access control

Immutable audit trails

GOVERNANCE CONTROL PLANE

Live execution controls

Identity

Permissions

Policy checks

Approvals

Audit trail

Monitoring

01 Agent request

02 Policy route

03 Human approval

04 System action

05 Evidence

DEMO CENTER

See governed execution in action.

Each demo shows the same governed sequence: context, policy check, agent action, human approval, and audit evidence – applied to a workflow your team will recognize.

REVENUE EXECUTION

CRM-to-Agreement Drift

Detect record drift, check policy, route approval, and capture audit evidence.

[Watch demo](#) →

WORKFORCE ACTIVATION

Hire-to-Onboard

Route tasks across HR, IT, facilities, and the manager with governed handoffs end to end.

[Watch demo](#) →

SPEND CONTROL

Spend Exception

Flag an invoice mismatch, check the budget owner, route approval, and record the decision.

[Watch demo](#) →

RESOURCES

Buyer education, product proof, and lead-generation assets.

Resources are separated by intent: gated whitepapers for strategic evaluation, open blog articles for category education, and demos for product proof.

WHITEPAPERS

Premium, gated strategy papers for buyers evaluating governed execution, agent security, and enterprise AI operating models.

[Read the whitepaper](#) →

BLOG

Ungated founder perspective, category education, and practical thinking for teams moving beyond AI experimentation.

[Read the blog](#) →

DEMOS

Ungated product proof showing systems, policy checks, agent action, approvals, and audit-ready evidence.

NEXT STEP

Enterprise AI does not have to start with a three-year program.

Start with one workflow. Tell us where work is breaking today.
